Abstract (en)
[origin: WO03063095A1] The invention concerns an electronic lottery device (10, 12) for lotteries or games and a method for the same. It comprises a processor circuit board (12) for controlling the same, which is connected to a random chance generator for determining the result of each lottery chance or game. It further comprises a counter (RV1) visible to a user of the device for registration of the number of lottery chances or games for lottery or game drawings, a counter (RV2) visible to a user of the device for new chances, a means (14) for initiating the start of a drawing and a means for presentation of the result of a completed drawing. With the random chance generator the drawing is accomplished in real-time. Additionally it comprises a counter (RV3) visible to a user of the device for registration of product prizes in the drawing. The counter for registration of product prizes prevents the counter (RV1) for the number of lotteries or games and the counter (RV2) for new chances from ending up in a constant drawing or winning loop, respectively.
