Abstract (en)

[origin: EP1471293A1] Two radial tabs (23) on the outer upper edge of a support (20) end with a radial plane (24) that engages abutments (33) on the inner surface of a knob (30) when the cap (1) is rotated in the screwing direction. To unscrew the cap, axial compression is applied to engage the axial teeth (25,35) on both the support and knob and rotationally rigidly couple the body and knob.
