Abstract (en)  
[origin: WO03030686A1] The invention concerns a system for arranging a central bar (2). Said central bar (2) extends at the level of limited structural elements (1A, 1B, 1C, 1D, 1E, 1F) forming three legs, said elements being assembled by bonding, in a vertical displacement direction between an assembly of guide bars (13, 13A) through a longitudinal groove (3), pressure being applied on a hinge pin (14) so as to enable central bar to be displaced. The bar has laterally at its two edges, over its entire length, a bevelled section (3A) which is adapted to the corresponding central groove (5E) of a plate (5). Said plate consists of two assembled parts (5, 5C) whereon is mounted a pivoting device (6) and it extends through the central bar in a vertical displacement direction. Another device (8) extends vertically on the central bar (2), which is shown in schematic representation, said device supporting a system (10) pivotable about an axis of rotation, said system itself bearing another system (11), the assembly enabling the panting to be pivoted, maintained and displaced in synchronism.
