Abstract (en)
[origin: WO03067008A1] The invention relates to a stop for doors and windows. Said stop consists of an elastic rubber body with a high friction coefficient, which has a thicker round region tapering to an adjacent narrow tip region. According to the invention, the narrow tip region is curved inwards and the width of the body is slightly larger than the distance between the perpendicular case of a window and its frame, the thickness of said body being proportioned in such a way that it can stand on its edge. A stop of this type is versatile for doors and windows and can hold windows at various open angles.
