Abstract (en)
[origin: EP1473749A2] The device has a control electromagnet provided with a movable pallet between a resting position and a working position under action of a coil (20). A slide coupled with the pallet operates an auxiliary contact (10) to provide a hysteresis function such that open and closed states of the contact obtained at end of course brings the pallet into working and resting positions, respectively. An independent claim is also included for an electrical interrupter with a control device.
