Abstract (en)
[origin: WO03059043A1] The invention relates to a support device which is used to fix fruit tree branches (6) or similar to stretched wires (3) or similar elements. The inventive device is characterised in that it comprises a single, continuous metal wire which is elastically deformable and which is folded so as to form a first fixing element (1) and a second support element (2) which is used to support the plant or tree. The aforementioned second support element (2) extends from the fixing element (1) and comprises an open loop (4) at the end thereof which is disposed at the end of a rod (5). Said rod (5) extends from the wire which is folded in a first plane in order to form a section that can be used to support a tree branch (6) or similar without said branch (6) coming into contact with the horizontally stretched wires (3).
