Abstract (en)

[origin: WO03010988A2] The invention relates to a method and system for determining position while using at least one radio signal receiving device (GSM), by means of which different radio channels can be received that are emitted from stationary transmitted devices (FSE) via a point-to-multipoint connection. At least one channel pattern is determined by using the radio channels received by the receiving device (GSM) and is, in turn, compared with predetermined reference patterns. The actual position of the radio signal receiving device (GSM) is then established based on this comparison.
