Abstract (en)

[origin: EP1474986A1] A bread maker according to the present invention including: a main body (1) forming an oven compartment (10); upper and lower kneading drums (11, 13) spaced apart from each other inside the oven compartment (10), each kneading drum (11, 13) having a holder (111) for holding opposite ends of a mixing bag (7) filled with raw materials; a drum driving part (35) rotating the upper and lower kneading drums (11, 13); a rotation sensing part (29) sensing rotation positions of the holder (111) of the upper kneading drums (11); and a controller (33) which controls the drum driving part (29) so that when an initial power is supplied, the upper kneading drum (11) is rotated by a predetermined angle to make the holder (111) of the upper kneading drum (11) stop within a predetermined angle range in which the holder (111) of the upper kneading drum (11) faces frontward on the basis of a position sensing signal of the rotation sensing part (29). Thus, in a predetermined process, holders (111) provided in kneading drums (11, 13) stop within a predetermined angle range in which the holders (111) thereof face frontward, so that the mixing bag (7) can be easily attached to the holders (111). <IMAGE>
