Abstract (en)

[origin: WO03070058A1] Locking strip (7) for securing a support member (4) at a chosen height along an upright (1) which is designed with at least one longitudinal and laterally open channel (2). The locking strip (7) comprises two side portions (20, 21) and a groove (22) running between these, and its dimensions are such that it can be inserted into the channel (2) in the upright (1) and can be locked in a desired position in the channel (2) with the aid of an element (6) which can be pressed through the lateral opening of the channel (2) and into the groove (1) of the locking strip (7). The locking strip (7) is made in one piece, the two side portions (20, 21) being connected by means of a material portion (23) which forms a bottom of the groove (22) along at least part of the length of the strip (7). The side portions of the strip (7) are designed with laterally projecting flanges (26, 27) which, when the strip (7) is inserted into and moved within the channel (2) in the upright, are intended to form guides extending on the outside of the upright. The invention also relates to a support member (4) which can be secured by means of the locking strip (7).
