Abstract (en)
[origin: WO03072635A1] The invention relates to prepolymers for native epoxide resins that can be used on an industrial scale or in the various areas of everyday life, e.g. as coating materials or adhesives. The invention also relates to a method for producing these prepolymers. The aim of the invention is to provide substances that are suitable as prepolymers, that are suitable for obtaining native epoxide resins and that can be produced without safety hazards at economical costs. According to the invention, polyhydroxy-polyepoxy fatty acid alkyl ester ethers are used as the prepolymers. They belong to a class of substances that comprises oxirane rings, ether compounds and OH groups, and that therefore correspond to the synthetic resin components to a high degree. According to the inventive method, fatty alkylesters are epoxidized with hydrogen peroxide under the influence of performic acid at a temperature of from 70 DEG C to 90 DEG C. A part of the epoxides produced immediately reacts to polyhydroxyethers. The product mixtures so produced are removed from the acid water at a temperature of approximately 65 DEG C using fine-meshed wire nettings. The remainder of the acid water is removed by vacuum evaporation.
