Abstract (en)

[origin: EP1479416A1] A procedure consists of making the outer decorative/ protective assembly and at least one additional component before the final manufacturing stages of the ski or snowboard. One or more holes are made in the assembly to receive fixing elements on the additional component, which are inserted through it so they project from its inner surface and can penetrate the inner structure of the ski prior to completion. The procedure consists of making the outer decorative/ protective assembly (3) and at least one additional component (8) before the final manufacturing stages of the ski or snowboard. One or more holes (17) are made in the assembly to receive fixing elements (11) on the additional component, which are inserted through it so they project from its inner surface (7) and can penetrate the inner structure of the ski or snowboard prior to completion. The fixing elements (11) have recesses (13) that are filled with a material that connects them to the inner structure of the ski or snowboard during the final stages of manufacture, e.g. incorporating an injection process. In one variant the recesses can be grooves, enabling the fixing elements to be retained by locking keys or rings (16). The additional components can be fitted so that their outer surfaces lie flush with the surface of the ski or snowboard.
