## Abstract (en)

The first design is based on a four-axle truck (10). The vehicle's combination of milling and transport allows for an improved workflow. There is no necessity for an interruption of the milling process anymore because the milled material is simultaneously transported into the vehicle's own container (11) via its own conveyor belt (16). A rotating cylinder broom (18) is located at the back of the vehicle (10) to sweep residues of the milled material to the side of the road. The second design is based on a smaller two-axle truck with a trailer. The milling head and conveyor belt are both connected to the truck. The conveyor belt is adjustable to fill the load area of the truck and the trailer. The third design is based on an arrangement where a trailer with a load area is fitted with the holding device, the milling head and the conveyor belt. The fourth design is based on a smaller truck with a second conveyor belt, which reaches over the front of the trucks driving cab to a truck, which drives in front of it. The fifth design is similar to the first but the holding device, milling head and conveyor belt are not located at the front of the vehicle but between the driving cab and the container.

## Abstract (de)

Die Erfindung betrifft ein Transportfahrzeug (10) mit einem Ladebehälter (11), welches sich dadurch auszeichnet, das hieran eine seitlich ausfahrbare, hydraulische Haltevorrichtung (13) mit am freien Ende angeordnetem Fräskopf (14) sowie eine Fördervorrichtung zum Transport von Fräsgut vom Bereich des Fräskopfs (14) in den Ladebehälter (11) angeordnet ist. Damit wird erstmals ein Gerät zur Fräsbearbeitung von Banketten bereitgestellt, mittels welchem bei geringem personellen Aufwand und reduziertem Fuhrpark gegenüber dem Stand der Technik weiterhin eine zuverlässige Bearbeitung des Banketts sowie auch ein verringerter Aufwand beim Umsetzen an einen anderen Einsatzort erzielbar sind. <IMAGE>
