Abstract (en)

[origin: WO03069322A2] The invention relates to a device for simultaneously testing the action of liquids on one or more surface structures (5). Said device comprises at least one continuous element (2) with a plurality of chambers, a cover (1) for closing said chambers and a drive for displacing the element (2). The invention is characterised in that the liquids in the chambers can be heated uniformly at a rate of more than 1 DEG C/s.
