Abstract (en)
[origin: WO03076290A1] The invention relates to a container (1), especially a bucket or similar, comprising an opening which is orientated upwards and which can be closed by a cover (3) and a peripheral container edge (2) which is drawn outwards in a downward direction on the container wall (5), whereby the cover (3) is detachably connected thereto, and whereon at least one tongue-like element (8) is connected in such a way that at least one part of the cover (3) is raised due to a pivoting movement away from an initial point on the container wall (5). According to the invention, the tongue-like element (8) engages with the container edge (2) from behind with part of said tongue-like element which can be guided outwards by the pivoting movement to a position in front of the container wall (2) and the part of said tongue-like element is prevented from being guided behind the container edge (2) when the tongue-like element (8) pivots back in the direction of the initial position.
