Abstract (en)

[origin: EP1345399A1] The method involves establishing a transmission path (2,7,19,25,26) from a first user via a packet network (9) to a second user, branching control signals required to control a service server (12) from the information flow between the users and forwarding them to the service server via a signalling network (15), evaluating the control signals in the service server and providing a requested service characteristic from the service server. An Independent claim is also included for the following: a gateway between a circuit network and a packet network, a service server for implementing a network service in a packet network, a media server for detecting user-generated information and a computer program product for operating a transfer point, service server or media server.
