Abstract (en)
[origin: WO03068601A1] The invention relates to a machine that is used to seal different containers comprising: a frame (12) which can move between a release position and a standby closed position; and a mechanism (40) for moving the mobile frame (12) between the standby closed position and a closed position. According to the invention, the movement mechanism (40) comprises at least one magnetic-field-producing coil (41) such that, when the frame is in the standby closed position, the magnetic field created by the coil acts on a circuit (43) that closes the magnetic field. Moreover, the frame (12) and the base (2) are designed to comprise means for positioning said frame (12) in the standby closed position, so that the magnetic field can be closed during the excitation of the coil.
