Abstract (en)  
[origin: WO03078748A1] The invention relates to a floor construction, comprising a plurality of loadbearing steel bars (24), preferably sheet metal profiles, and one or more superposed panel elements (17), such as gypsum boards. The panel elements (17) are supported by the steel bars (24) via (i) at least one trapezoidal metal sheet (16) or the like, which defines an intermediate horizontal plane of the floor construction and which forms a plurality of ducts (133) for laying of installation components (138), such as lines and pipes, in the intermediate horizontal plane; and (ii) a plurality of spacers (132) which are distributed in the intermediate horizontal plane in at least one zone (IZ-1; IZ2), termed installation zone, at the side of the trapezoidal metal sheet (16) where said ducts (133) open, and which spacers (138) horizontally between them define spaces in which said installation components (138) are adapted to be laid also in other directions (139) than the direction of the ducts (133) of the trapezoidal metal sheet (16). The invention also relates to a method of manufacturing a floor construction and a modular building comprising such a construction.
