Abstract (en)
The invention relates to a treadmill comprising a frame structure (1) supported to a floor (2) by means of a subframe (3) and a belt part (4) arranged for being supported by the frame structure. The belt part (4) is formed into an endless loop and arranged to run around front and rear roller parts (5, 6). The treadmill also comprises means for adjusting the inclination of the frame structure and the frame structure (1) is arranged to fold about a pivoted axle (10) provided at one end of the frame structure from a use position to a storage position and vice versa. The pivoted axle (10) arranged in the frame structure (1) is connected to the subframe (3) by means of at least one connecting rod (11). <IMAGE>
