Abstract (en)

[origin: WO03083794A1] A gaming apparatus may comprise a display unit that is capable of generating video images, a value input device capable of allowing the player to deposit a medium of value, and a controller operatively coupled to the display unit and value input device. The controller includes a processor and a memory operatively coupled to the processor, where the controller is programmed to allow a person to make at least one wager and is further programmed to cause a video image to be generated on the display unit. The video unit representing a game selected, by the player, from the group consisting of video poker, video slots, video keno bingo. The controller is further programmed to determine a outcome of the game chosen by the player and a value payout associated with the outcome. The controller is further programmed to generate an audible explanation of the value payout based on the information defined in the stored payout data contained within the controller.
