Abstract (en)

There is described a hand-held grinding tool (1,101,201) with a replaceable grinding-plate part (13,113,213), preferably consisting of a steel plate, where on a grinding surface there is applied an abrasive coating in the form of grains of hard metal, which is preferably secured by soldering. The hand tool further comprises a handling part and clamping means (8,10,14,125,208,214) for clamping the grinding-plate part to the handling part (2,202) in a replaceable manner. By being able to replace the grinding-plate part alone, considerable savings are achieved in the use of the tool, while at the same time the advantages of the use of grinding plates with hard metal grains are also achieved. <??>The grinding tool according to the invention is intended for grinding by hand, i.e. without a motor-driven movement of the grinding surface, and is preferably configured in a light construction of plastic, aluminium, wood or the like, and can be configured with or without a handgrip, and can be provided with an arrangement for the mounting of a shaft for grinding with the user standing upright. <IMAGE>
