Abstract (en)  
[origin: WO03084794A1] The invention concerns an improvement to a non-tilt means acting on the follower and support plate (20) for which a lateral support is in friction sliding support contact with an axle bar (9). According to one embodiment, said non-tilt means is produced in the form of two torsional blades (55) and (56) whereof one end of each of them is fixed to the corresponding end of the follower and support plate (20) and the other end is fixed to an independent support of the axle bar (19). The present invention is of interest to manufacturers of railway train sets, in particular those with common axle.
