Abstract (en)
[origin: WO2004024295A1] A columnar honeycomb structure (filter) having a low pressure loss when particulates are collected, allowing large amount of particulates and ash to be deposited thereon, and making it difficult for cracking to occur therein, comprising a large number of through-holes longitudinally arranged parallel with each other and wall parts separating the plurality of through-holes from each other and forming an outer peripheral surface, the large number of through-holes further comprising a large volume through-hole group formed by sealing one end part so that the sum of the areas in a cross section vertical to the longitudinal direction of the honeycomb structure is relatively increased and a small volume through-hole group formed by sealing the other end part so that the sum of the areas in the cross section is relatively decreased, characterized in that the outer peripheral surface of the columnar honeycomb structure has chamfered corner parts.
