Abstract (en)

[origin: WO03086540A1] The invention relates to a device for evacuating people from a building (2) comprising a part which can be placed into a functional position from a non-functional position. In the functional position, said part forms a rescue channel (29) leading from an upper floor of a building to a floor area (20). The part forming the rescue channel (29) is embodied as a tube (7) which is folded together when in the non-functional position, said tube extending in an essentially vertical manner with respect to the building wall (22) when in the functional position. Braking means are provided for the safe conveyance of people through the rescue channel (29) to the floor area (20). As a result of said device, people in an emergency situation, for example a fire, can be evacuated from a building in a fast and secure manner.
