Abstract (en)

[origin: WO03086723A1] The invention relates to a method for manufacturing a shaft bottom part from concrete that comprises lateral exits in the wall. According to said method, a support cage (5) with retaining shoulders (5a) to which molded elements (8) for the exits are fixed is assembled outside the machine and is introduced into the space between the mold exterior (6) and the mold core (4) of the manufacturing machine. The space in which the support cage (5) is disposed is then filled with concrete and the concrete is rapped in. The support cage (5) remains in undismantled state in the space and is removed from the manufacturing machine together with the freshly molded body once the concrete is rapped in. The support cage (5) is exclusively dismantled outside the manufacturing machine.
