Abstract (en)

[origin: WO03074275A1] The invention relates to a method for operating a printing unit with at least one counter printing cylinder and a cylinder forming a pressure point with the above, whereby the counter printing cylinder is driven by a first motor, mechanically independently of the cylinder and a circumferential speed in the region of the nip-point of the both cylinders can be varied relative to each other as soon as a threshold value for set power or an applied torque for the drive motor driving the counter printing cylinder or the cylinder is exceeded at the printing point.
