Abstract (en)

[origin: WO03087509A1] The invention relates to a guide rail arrangement for a door, particularly a sectional door, comprising a leaf. Said guide rail arrangement creates a track which is provided with two approximately linear segments and a connection segment joining the linear segments and is used for directing the movement of a door leaf between an open position and a closed position. The inventive guide rail arrangement comprises two rail elements which form a linear segment and are assembled so as to create a guide rail such that the linear segments of the track jointly enclose an angle of less than 180 DEG , preferably about 90 DEG . Each of the rail elements is provided with an essentially linear section and a curved section which is arranged at the end of the linear section, is produced as a single piece therewith, and forms the connection segment.
