Abstract (en)

[origin: WO03087857A2] The invention relates to a method and device for picking up and processing interference fields and interference beams in the form of immissions from technical high-frequency sources provided with a ring antenna pick-up and with a measuring circuit. In addition to precisely analyzing the field intensity of a high-frequency immission, above all, also all relevant criteria of the low-frequency effects particularly from 0 100 Hz, a novel measuring pick-up method enables, for the first time, the precise analysis of field effects below 0.1 V/m and, for example, the detection of brain-active and heart-active interference frequencies. The processing of the signals picked-up by a ring antenna pick-up ensues via at least one diode with an opposite blocking direction connected to the corresponding signal line whereby, after the output of the diodes, both signal lines are connected via a capacitor device to a measuring device. According to a second embodiment, the ring antenna pick-up has more than one, preferably concentrically and annularly arranged conductor track, whereby the processing of the signals picked-up by the more than one conductor track ensues over a resistor network connected to a measuring device via at least two signal lines.
