Abstract (en)

[origin: WO03087962A1] The invention relates to a method for reconfiguring an automation device. According to said method, newly supplied configuration data of a hardware configuration can be evaluated with a view to modifying said configuration and can be integrated during a configuration interval without the automation device having to adopt a STOP mode. Centralised and/or decentralised peripheral subassemblies are not therefore required to adopt an operationally safe mode, which means that operational control can be resumed immediately after the reconfiguration.
