Abstract (en)

[origin: FR2838594A1] The communication connection consenting mechanism has entities (101,102) with users (91,92) associated with communications equipment (1,2) and a man machine interface. There are two phases of communication the first in which demands are transmitted in a first direction and the received signals identified and scrutinized. The second phase carries out the same process in the reverse direction. A memory in the equipment searches for the two signalling sets from two users and finds when mutual communication is available.
