Abstract (en)
It includes an aeration system for ventilating the wearer's feet, in such a way that the sole includes at least in one area of the support surface some through holes (5) that correspond with some projecting portions (4) located in an inside cavity (1) where a main piece (3) that has hollow projections (7) that are complemented with the projecting portions (4) is coupled and located. At the same time from the inside of the hollow projections (7) some elongated lugs that are located in the through holes (5) originate. <??>The main piece (3) includes other holes (11) in order to permit the flow of a stream of air that reaches the wearer's feet through other holes (13) of an insole (12) where the wearer's feet rest. <??>Hence, the intake and discharge of air is produced thanks to the slight upward and downward movement of the main piece when the wearer walks. <IMAGE>
