Abstract (en)

[origin: WO03091023A1] The invention relates to a lift (03a) for use on a cylinder (010a) of a rotary printing machine. The lift comprises a trailing end (12) having a folded limb (0.5) which is arranged in the direction of production of the cylinder. The limb comprises a flexible edge provided with a first lifting arm (26) directed towards the edge of the limb protruding from the flexible edge, and a second lifting arm (27) arranged between the flexible edge (28) of the limb and the edge of the end of the limb. The two lifting arms form together a blunt (phi) angle extending from the flexible edge (28) on the side of the limb connected to a working surface of the lift.
