Abstract (en)
[origin: WO03089303A1] The invention relates to an improved device and method for wrapping unit loads or packaged goods (3) using an at least approximately hood-shaped, elastic section of film (25) which is gathered into folds (26), stretched, and then pulled over the unit load or packed goods (3). The gathered film section (25) is stretched by means of a covering element (1) which can be displaced along the unit load or packaged goods (3), and is pulled over the unit load or packaged goods (3). Generally, the covering device (1) can comprise four tensioning fingers (2) which can be moved in the plane perpendicular to the covering direction (5) and respectively comprise a bow-shaped tensioning element (4) extending essentially in said plane and a bow-shaped supporting element (6) which is fixed to the tensioning element and extends essentially in the covering direction (5), such that the gathered film section (25) is received in the regions respectively corresponding to the corners of the unit load or packaged goods (3) to be wrapped, and is then pulled over the unit load or packaged goods (3).
