Abstract (en)  
[origin: WO03080470A2] The invention relates to a fluid product dispenser. The inventive dispenser consists of: an entraining gas container (10) comprising actuation means (12') which pressurise the gas in the container, a fluid product container (3), and a dispensing orifice (21) which is designed for the passage of a mixture of entraining gas and fluid product. The aforementioned fluid product container (3) is separated from the gas container (10) by means of a partition (31"; 31'") which is permeable to the gas and impermeable to the fluid product, such that the pressurised gas enters the fluid product container (3) through the partition and carries the fluid product therewith towards the dispensing orifice. The invention is characterised in that the fluid product is moved towards the dispensing orifice by push means (32", 32'"), such that there is always fluid product at the dispensing orifice during the dispensing of said fluid.
