Abstract (en)

[origin: WO03089356A1] The invention relates to a device for actuating and locking elevator doors comprising driving runners (14, 15) which are mounted on a car door (104a, 104b) and actuate shaft door drive rollers (109, 110) used for actuating shaft doors (111). The inventive device comprises an actuator which modifies the distance (d₀, d₁, d₂) between the driving runners (14, 15) and is provided with an actuating lever (1) that is connected to a door drive unit. Said actuating lever (1) is connected to a first swiveling lever (10) so as to cooperate therewith. The driving runners (14, 15) are hingably connected to said swiveling lever (10). A locking device is configured such that it locks the car door (104a, 104b). The actuating lever (1) and the first swiveling lever (10) are pivotable towards each other by a predefined angle. The locking device is connected to a traction element (20) which is hingably connected to one driving runner (15) and the actuating lever (1).
