Abstract (en)

[origin: WO03093055A1] A road transport vehicle has a body (102) with a rear opening. A loading platform (112) is movable along a first guide path (109, 110, 116, 117) along the body and along a second upright guide path (114, 115, 121, 122). The first guide path extends out through the rear opening so that the platform (112) can be moved between a position within the body and a position out of the body for example at a ground surface below the load-supporting floor of the body at the rear of the vehicle. The first guide path may be defined by tracks (109, 110) on a side wall (107) of the body along which arms (116, 117) can run to extend beyond the rear opening. The second guide path may also be defined by tracks (114, 115) mounted on these arms (116, 117), along which run upright supports (121, 122) attached to the loading platform (112).
