Abstract (en)  
[origin: WO03091468A1] A method for forging a titanium alloy having a beta-transformation temperature of  $T_{\beta}$  (°C), which comprises satisfying the relationships of  $(T_{\beta} - 400)^{\circ}\text{C} \leq T_m$  and  $400^{\circ}\text{C} \leq T_d \leq 700^{\circ}\text{C}$ , wherein  $T_m$  and  $T_d$  represent the temperature of a material to be forged and the temperature of a mold, respectively, and carrying out the forging of the alloy at a strain rate of  $2 \times 10^{-4} \text{ s}^{-1}$  to  $1 \text{ s}^{-1}$ , and preferably further satisfying the relationship of  $T_m - T_d \leq 250^{\circ}\text{C}$  and/or using a titanium alloy having a specific chemical composition. A titanium alloy material having been forged by the above method has a microstructure being fine and controlled so as to have a predetermined structure, and thus exhibits material properties being nearly uniform in the thickness direction thereof, is excellent in ductility and fatigue characteristics, is easy to finish the surface after forging, is less susceptible to cracking, and exhibits excellent formability.
