Abstract (en)
A ladder-restraining device for restraining a ladder to a structure, comprising a mounting means for mounting the ladder-restraining device to the structure, a first enclosing member and a second enclosing member, said second enclosing member being movable relative to the first enclosing member, and a means to allow a user to move the second enclosing member relative to the first enclosing member from a position remote from the device. The ladder restraining device having an open condition wherein the first and second enclosing members define an opening adapted to allow a rung of a ladder to enter said opening, and a closed condition wherein said opening is reduced or eliminated. The first and second enclosing members together form an enclosure which is adapted, in use, to at least partially enclose a rung of a ladder and retain the rung in the enclosure.
