Abstract (en)
[origin: WO03096851A1] The invention concerns an apparatus designed to facilitate slipping on a limb, a tubular compression orthosis, such as a compressive stocking made of elastic material, or the like. The invention is characterized in that it comprises a support arm (6), an stretching clamp (1) including a tubular body (7) mounted longitudinally sliding, on the support arm (6) and two opposite jaws (8, 9) with substantially parallel stretching plates (12, 15), whereon can be slipped a tubular orthosis in retracted inactive state, and a mechanism (2) for controlling the opening of the stretching clamp (1) to exert a thrust to gradually move the second jaw (9) away from the first jaw (8) up to an extreme position corresponding to the maximum stretched position of the orthosis, said stretching being maintained by self-wedging. The invention also concerns a device for removing a tubular compression orthosis or the like.
