Abstract (en)
[origin: WO03093653A1] The invention relates to a steam turbine (3) comprising a valve arrangement (5) for regulating the admission of live steam into the turbine consisting of two serially connected regulating valves (6, 7). The two regulating valves (6,7) enable a step-by-step separation of the live steam and ensure operational security in the case of a partial load operation of the turbine. Said valve arrangement is particularly suitable for steam turbines devoid of regulating steps in a fixed-pressure operation mode.
