Abstract (en)
[origin: WO03096167A2] The invention relates to a method for detecting events during the implementation of a process, using a detection device which is associated with an implementation means for the process and contains a data carrier. The invention also relates to a software program for the detection device and to the detection device itself. The invention is characterised in that the data carrier can be exchanged and is associated with the process, and the events are stored in said data carrier. The process data is thus, according to the system, no longer required to be centrally planned, centrally evaluated and implemented. The use of the invention is especially easy and requires especially only minimum necessary input from the user.
