Abstract (en)
[origin: WO03096923A1] A handle-free device is described which allows careful dental prevention and hygiene and which comprises a supporting frame (made of latex or other soft material) at one end of which there is a cavity whilst at the other end there is a ring. Bristles are applied to the part of the frame where the cavity is present, preferably borne by a base body inserted in the framework; advantageously, the base body also holds a capsule containing an oral hygiene product. To use the device the user inserts two fingers of the same hand into the cavity and the ring; preferably the user inserts the index finger into the cavity and the thumb from the same hand into the ring.
