Abstract (en)

[origin: US2005158680A1] The invention relates to a container for liquid, pasty, and/or solid materials, comprising a base, a ring element, at least one opening, and a membrane which forms an outer surface and is arranged between the base and the ring element. The base and the ring element can be connected to each other. An energy storing device is disposed between the base and the ring element. In order to further develop a container in such a way that said container can be used as a supplementary multifunctional low-weight storage device while being easy to handle, the ring element (3) can be twisted at least in a limited manner relative to the base (2) around the longitudinal axis of the membrane (5) in order to open or close a bayonet-type closure which is disposed on the ring element (3) and the base (2).
