Abstract (en)
[origin: WO03099065A1] The invention relates to a framework construction, for example, a bookshelf or the like, consisting of a plurality of profiled carriers (1, 2, 3), two types of profiled carriers (1; 2, 3) being provided. The first profiled carriers (1), which comprise tapped holes (g) arranged vertically in relation to the longitudinal axis (B) thereof, are to be transversally mounted, i.e. depth-wise, while the second profiled carriers (2, 3), which comprise axially arranged threaded bolts (G1, G2) on the ends thereof, are to be mounted length-wise and height-wise. At least one of the threaded bolts (G2) can be axially displaced and rotatably mounted. Said threaded bolt comprises an engaging device on its free end, which enables it (G2) to be screwed down, for example by means of a simple spanner (S). In this way, the inventive framework construction consists of only two parts. Additional connection or fixing elements are not required. Said framework construction is very suitable for self-assembly.
