Abstract (en)
[origin: WO03103430A1] The outsole (1, 3), particularly for sports shoes (2), can be provided with a high degree of elastic deformability in a tangential direction thereby achieving a good cushioning even when the shoe strikes the ground with a slanted and somewhat sliding impact. The invention provides that the outsole (1), beyond at least one critical deformation in the area deformed thus far, is, however, essentially stiff with regard to tangential deformation. This provides the runner with a more sure footing on the respective impact or loading point. The runner can push off once again from the loading point also without losing ground. A floating effect on the sole is thus prevented. The sole can, as a whole or in several parts, also be detachably fastened to a middle sole (4) of the shoe (2).
