Abstract (en)
[origin: WO03089351A1] The invention relates to a device for winding a material web, in particular thin or thick films used for road marking. Said device comprises a receiving unit (1), which has a winding reel (2) for rolling up the material web (3). The aim of the invention is to wind a material web (3) using simple resources at different locations without problems. This is achieved by a vehicle (4) that can preferably be reversibly coupled to the receiving unit (1). In addition, the invention relates to a method for winding a material web, in particular thin or thick films used for road marking. Said method comprises a receiving unit (1), whereby the latter (1) has a winding reel (2) for rolling up the material web (3). According to said method, the receiving unit (1) is driven along a carriageway (5) whilst the material web (3) is removed from said carriageway (5) and wound onto the winding reel (2). The invention further relates to a receiving unit (1) comprising a winding reel (2) for rolling up the material web (3).
