Abstract (en)
[origin: WO03104445A1] The present invention concerns a novel aldehyde dehydrogenase having the following physico-chemical properties: a molecular weight of $190,000 \pm 15,000$ Da which comprises a subunit structure of two alpha subunits and one beta subunit, or a molecular weight of $250,000 \pm 20,000$ Da which comprises a subunit structure of two alpha subunits and two beta subunits, in which the alpha subunit has a molecular weight of $75,000 \pm 3,000$ Da and the beta subunit has a molecular weight of $55,000 \pm 2,000$ Da; dehydrogenase activity on L-sorbose, D-glucosone, D-glucose and D-xylose; utilizes as cofactor pyrroloquinoline quinone and heme c; has an optimum pH of from about 6.5 to about 8.0 for the production of vitamin C and an optimum pH of about 9.0 for the production of 2-keto-L-gulonic acid from L-sorbose; and is inhibited by Co $<2+>$, Cu $<2+>$, Fe $<3+>$, Ni $<2+>$, Zn $<2+>$, Mg $<2+>$, monoiodoacetate, and sodium azide.
