Abstract (en)

[origin: WO03002821A1] The invention relates to a surfacing structure for traffic areas and for surfaces of structures, which has a substructure located on the base of the surfacing and has a superstructure, which covers the latter and is comprised, at least in part, of concrete, especially of asphaltic concrete. The substructure comprises at least one lattice work extending along the surfacing and having a number of strips, which intersect while forming a mesh, consist of high-strength fiber billets with different tensile E-moduli, and which are interconnected with material fit or in a non-positive manner. A thermally removable covering can be applied to at least one surface of the lattice work.
