Abstract (en)

[origin: EP1510472A1] The container/dispenser (1) consists of a flask (2) with an inner deformable pouch (5) for the product made from two layers (6, 7) of the same material or different materials, joined together by a direct physico-chemical reaction. Each of the layers of the pouch has at least 80 per cent of its mass made from one or more components of the same chemical family. The container/dispenser (1) consists of a flask (2) with an inner deformable pouch (5) for the product made from two layers (6, 7) of the same material or different materials, joined together by a direct physico-chemical reaction. Each of the layers of the pouch has at least 80 per cent of its mass made from one or more components of the same chemical family. The pouch can have a filler to make it colored or opaque for easy detection, and the layers can be coextruded or made by extrusion blowing; they can also be coextruded with the flask.
