Abstract (en)

[origin: EP1510480A1] The device has a jogging unit (16) to jog a stack of mail articles against a reference wall (18). A selecting unit (20) extracts the articles from the stack. A printing unit (22) prints stamps on the articles. Anti-bias levers are positioned at a determined distance from the wall. An end of each lever extends across an opening (12A) made in a receiving plate to define an obstacle for the articles, above the plate.
