Abstract (en)

[origin: EP1512913A1] The system has internal and external spins arranged in downstream of a fuel injector. Cold plasma generation units are arranged in the downstream of the internal and external spins to generate active species in the flow of an air/fuel mixture. The generation units pre-break the molecules of the mixture. Control systems (48) control the generation units according to the functioning speed of a turbo-machine. The cold plasma generation units are formed by two pairs of electrodes (42, 42) disposed on the circumference of the end of a venturi (26).
